Hiring Team
IXL Learning
Engineering
San Mateo, CA

Dear IXL Learning Hiring Team,

What drew me to the Software Engineer, New Grad role is the chance to own features end-to-end across back-end wiring, application logic, and UI. At Product Manager Accelerator I shipped a full-stack web feature from data to UI, and at UMBC my graduate assistantship has me coordinating delivery across multiple teams. Building for students and teachers makes that ownership feel worth it.

The role's mix of back-end services, application logic, and UI lines up closely with my recent work. At Product Manager Accelerator I built a React and D3 cohort analytics dashboard backed by a Python REST API and PostgreSQL, owning the feature from data model through interactive visualizations and replacing the team's manual weekly status reporting; the curriculum team later reused the same API to drive lesson recommendations. At Platinum Business Services I am developing Python backend services and data workflows for Cyberdome, an AI-driven GRC assessment platform, including vector embedding and retrieval pipelines on Qdrant that enable RAG-based querying against control frameworks like NIST 800-53 and FedRAMP. Earlier, at Turfco Landscape Co., I shipped a full-stack JavaScript application with authentication, payments, and a rule-based cost estimation engine, which is the kind of end-to-end ownership the role calls for.

A few of the listing's expectations match where I've spent the past year. At UMBC my graduate assistantship has me working both independently and alongside multiple student teams, which is the same posture the listing calls for. The mission to improve education through technology is also part of why I am applying, and a semester as a Data Structures TA reinforced that. I graduate from UMBC in May 2026 and am available to start full-time immediately after. I'd welcome a conversation with the team about next steps.

Sincerely,
Anupreet Singh
