Hiring Team
Airbnb
Quality Reputation
San Francisco, CA

Dear Airbnb Hiring Team,

Airbnb's Quality Reputation team builds the customer-facing iOS products and intelligent systems that protect millions of guests and hosts by surfacing quality signals and intervening before bad experiences happen. I am applying for the iOS Software Engineer - New Grad role because shipping consumer-grade iOS features that combine careful UI craft with backend signals is exactly the kind of engineering work I want to do.

At Product Manager Accelerator, I shipped an iOS dashboard in Swift and SwiftUI backed by a REST API with GraphQL queries and offline caching, cutting median session load times by 35% across 500+ daily PM users. To keep that release safe, I added async error handling, automated UI tests, and TestFlight rollout gates that brought crash rates down by 20%. An earlier consumer-facing MERN-stack project at Turfco Landscape, with user authentication, payments, and a rule-based cost engine, reinforced the same discipline of owning a customer-facing product end to end.

Coursework in Data Structures & Algorithms, Object Oriented Design, and Machine Learning gives me the foundations this role calls for, including the design patterns and systems thinking the team relies on. Hands-on transformer work on a Mistral-7B game project gives me the AI background to contribute to Airbnb's AI-powered iOS features as I learn the platform. I would be excited to onboard alongside Quality Reputation engineers, collaborate cross-functionally with product, design, and data science partners, and ship well-tested iOS features that raise supply quality for hosts and guests.

Sincerely,
Anupreet Singh
