Hiring Team

Esri

ArcGIS Data Pipelines Team

Redlands, CA

Dear Esri Hiring Team,

I am excited to apply for the Backend Software Engineer role on the ArcGIS Data Pipelines Team. Your mission of turning complex geospatial information into systems people can trust mirrors the work I most enjoy: building reliable backend services, connectors, and data workflows that help users make timely decisions.

At Product Manager Accelerator, I shipped a Python REST API and source connectors that ingested partner CSV/JSON into PostgreSQL and AWS S3, with CI/CD and OpenTelemetry tracing, cutting analyst onboarding time 30% across 6 partners. I added pytest API suites and database tracing that reduced production incidents by 40%. At Platinum Business Services, I am building Cyberdome's retrieval pipelines on Qdrant, integrating OpenAI and local Ollama RAG services for context-aware querying and automated validation, an example of applying AI to improve engineering workflows.

My coursework and projects in API design, system design, distributed systems, and geospatial data processing, paired with hands-on Python, Java, SQL, Docker, and Kubernetes experience, prepare me to design and own services that run from cloud-native SaaS to on-premises deployments. I would welcome the chance to collaborate with your product, frontend, and platform teams to translate ideas into concrete, well-tested implementations.

Sincerely,

Anupreet Singh
