Hiring Team
Twitch
Commerce Engineering
Seattle, WA

Dear Twitch Hiring Team,

Twitch's Commerce Engineering team owns the products — Subscriptions, Bits, Gifting, and Hype Train — that form the real-time economic layer between creators and millions of concurrent viewers. I am applying for the Software Engineer role on this team because building consumer-facing transactional systems at live-streaming scale is precisely the kind of engineering challenge I want to work on.

At Product Manager Accelerator, I built an end-to-end subscription management feature in React and Node.js, backed by a REST API backend that processed 500+ daily transactions, and shipped a companion Go microservice for real-time subscription event alerts that cut notification latency by 70%. The full-stack scope — transactional backend, consumer-facing UI, and a low-latency delivery path — maps directly to what Twitch Commerce Engineering ships across its subscription and engagement products. An earlier internship building a consumer-facing MERN-stack application with user authentication and payment flows at Turfco Landscape reinforced the same discipline of owning a complete, user-facing system end to end.

My coursework in Data Structures & Algorithms and Distributed Systems has given me the foundations this role requires: algorithm reasoning, schema design, and intuition for systems that hold under concurrent load. That background, combined with production experience across full-stack layers and hands-on AWS usage, positions me to ramp quickly and contribute to Twitch's commerce products. I look forward to collaborating cross-functionally, owning full-stack features end to end, and helping ship the transactional and engagement systems that power the Twitch creator economy.

Sincerely,
Anupreet Singh
