Hiring Team
SeatGeek
Engineering
New York, NY

Dear SeatGeek Hiring Team,

I am applying for the Software Engineer - New Grad role because solving customer-facing problems on a marketplace where every transaction touches real-world inventory is exactly the kind of engineering work I want to do.

At Product Manager Accelerator, I shipped a PM project-tracking dashboard end to end: a React/TypeScript frontend on top of a Go REST API with Postgres for persistence and Redis caching on AWS, reducing report turnaround by 40% across 500+ daily PM users. To make that delivery routine, I containerized the services with Docker and automated GitLab CI/CD pipelines, cutting deploys from 30 to 5 minutes. An earlier MERN-stack project at Turfco Landscape with user authentication, payments, and a rule-based cost estimation engine reinforced the same discipline of owning a consumer-facing transactional product end to end.

Coursework in Software Engineering, Distributed Systems, and Databases gives me the foundations this role calls for code-quality discipline, schema design, and intuition for systems that hold under concurrent marketplace load and my full-stack and AWS experience prepares me to ramp quickly. I would be excited to collaborate cross-functionally with SeatGeek's engineers, own features across the marketplace's backend and frontend layers, and help ship reliable, well-tested software for fans and partners.

Sincerely,
Anupreet Singh
