Hiring Team
CarGurus
Inventory Platform
Hybrid

Dear CarGurus Hiring Team,

Software Development Engineer I is appealing because it combines backend services, data pipelines, and production ownership. My work on Cyberdome at Platinum Business Services, a backend API project at Product Manager Accelerator, and graduate assistant support for code reviews maps closely to those responsibilities.

At Product Manager Accelerator, I built a Java and Spring Boot REST API with Elasticsearch and Docker on AWS to index AI briefs, cutting prep time by 30% and producing reusable documentation for later teams. That experience is the clearest match to CarGurus' need for clean, well-tested code around data-intensive workflows. At Platinum Business Services, I engineered Qdrant-based embedding and retrieval pipelines for Cyberdome, using OpenAI and Ollama models to enrich control data for automated validation and context-aware querying, which aligns with ingestion and enrichment work on marketplace inventory. I also bring habits that help junior engineers ship reliably: as a Graduate Assistant, I supported Agile/Scrum teams through architecture planning, code review feedback, testing guidance, and stakeholder coordination, and at Turfco I built a Node.js REST prototype with authentication, payments, and rule-based estimation.

The role's emphasis on collaboration, technical discussions, and a growth mindset fits how I have been trained to work. As a Graduate Assistant, I give testing and review feedback across Agile/Scrum teams, and as a Teaching Assistant, I have learned to explain core CS concepts clearly and ask focused questions when students are stuck. I would value the chance to speak with the Inventory Platform team about the next interview step and how I could contribute while continuing to grow.

Sincerely,
Anupreet Singh
