Hiring Team
HeyProactive
Founding Team
United States

Dear HeyProactive Hiring Team,

The AI Marketing Intern role drew me in because the day-to-day blends two things I do in parallel: shipping product features real users touch, and prototyping AI agents that reimagine human-computer interaction. My internships at Platinum Business Services and Product Manager Accelerator covered the first; a transformer-based graduate project covered the second.

At Platinum Business Services, I am building backend services and retrieval pipelines for Cyberdome, an AI-driven GRC platform. I stood up Qdrant-backed vector embedding and RAG querying against OpenAI and local Ollama models, which is the closest analog I have to the agent and integration work in your day-to-day. Claude Code and Codex are part of my workflow today, so the agentic coding rhythm you describe is already familiar.

At Product Manager Accelerator, I shipped a Java and React app where PM trainees submit assignments and an AI agent flags common mistakes for coaches, cutting session prep time by roughly 40 percent. It runs on AWS with DynamoDB and has been reused across cohorts after the pilot, which gave me first-hand exposure to building, polishing, and iterating on a product feature that actual users return to.

On the side, I built a Bloodborne-inspired text adventure that uses Mistral-7B with few-shot prompting to map free-form player commands to in-game actions, modeled in JSON schemas. That project is the most direct version I have of prototyping an AI experience that reimagine human-computer interaction.

On the soft side, my Graduate Assistant work coordinating Agile/Scrum across multiple 400-level teams has given me a real feel for collaborating closely under shifting requirements, the closest fit I have to the founder-adjacent rhythm you describe. My time as a Teaching Assistant in Data Structures, holding office hours for OOP projects, is where I learned to ask questions out loud and admit when I had the wrong mental model. I would love to walk through any of these in a first conversation with the founding team.

Sincerely,
Anupreet Singh
