Hiring Team
Airbnb
Engineering
San Francisco, CA

Dear Airbnb Hiring Team,

I am applying for the Software Engineer, New Grad role because the JD pairs everyday SWE feature delivery with hands-on AI/ML integration in product surfaces like search and personalization. That is the same combination I have been pursuing across my internships and graduate projects.

On the AI/ML side, my current Data AI internship at Platinum Business Services has me building RAG retrieval pipelines on Qdrant against OpenAI and local Ollama LLM APIs to automate compliance control validation, complemented by transformer-based graduate projects mapping natural-language player commands to in-game actions with Mistral-7B and a lexically constrained EN-RU machine translation system. On the production engineering side, an internship at Product Manager Accelerator gave me end-to-end full-stack experience shipping a self-serve PM dashboard with a React and TypeScript frontend on a Java Spring Boot REST API, Postgres and Redis on AWS, deployed via Docker on Kubernetes with Kafka event streams, while an earlier MERN-stack build at Turfco Landscape covered consumer-facing essentials like authentication, payments, and a rule-based pricing engine.

My academic roles at UMBC round out the SWE practices the JD highlights: as a Graduate Assistant, I have run code reviews and coordinated with cross-functional stakeholders across multiple Agile/Scrum teams while grading coursework on software design, testing, and code quality, and as a Teaching Assistant on Data Structures I mentored students during office hours on OOP projects and supported homework design and grading. I would be excited to bring that mix of feature-shipping discipline and investment in others into Airbnb's engineering culture, collaborate cross-functionally with product, design, and data partners, and ship well-tested AI-backed features for hosts and guests.

Sincerely,
Anupreet Singh
